

DEVOPS - DOMINGUES Vincent

TP3 DOCKER

- Créer un wrapper qui retourne la météo d'un lieu donné avec sa latitude et sa longitude (passées en variable d'environnement) en utilisant openweather API dans le langage de programmation de votre choix (bash, python, go, nodejs, etc)

```
tp3docker.py > ...
1  import requests
2  import os
3  from pprint import pprint
4
5
6  def weather(lat,lon,apiKey):
7      url = 'https://api.openweathermap.org/data/2.5/weather?lat={}&lon={}&appid={}'.format(lat,lon,apiKey)
8      res=requests.get(url)
9      data=res.json()
10     return data
11     #print(res)
12
13     lat = os.environ['LAT']
14     lon = os.environ['LONG']
15     apiKey = os.environ['API_KEY']
16
17     print(weather(lat,lon,apiKey))
```

- Packager son code dans une image Docker

```
PS C:\Users\user\Documents\coursS7\devops> docker images
REPOSITORY          TAG         IMAGE ID      CREATED        SIZE
devops              latest     cd3216ca22f0  6 minutes ago  948MB
docker/getting-started latest     cb90f98fd791  7 weeks ago   28.8MB
PS C:\Users\user\Documents\coursS7\devops> docker tag cd3216ca22f0 devops
```

- Mettre à disposition son image sur Docker

```
> Executing task: docker push inesmankour/devops:latest <

The push refers to repository [docker.io/inesmankour/devops]
